

Coffeeshop

Modern mobile application for quick coffee ordering

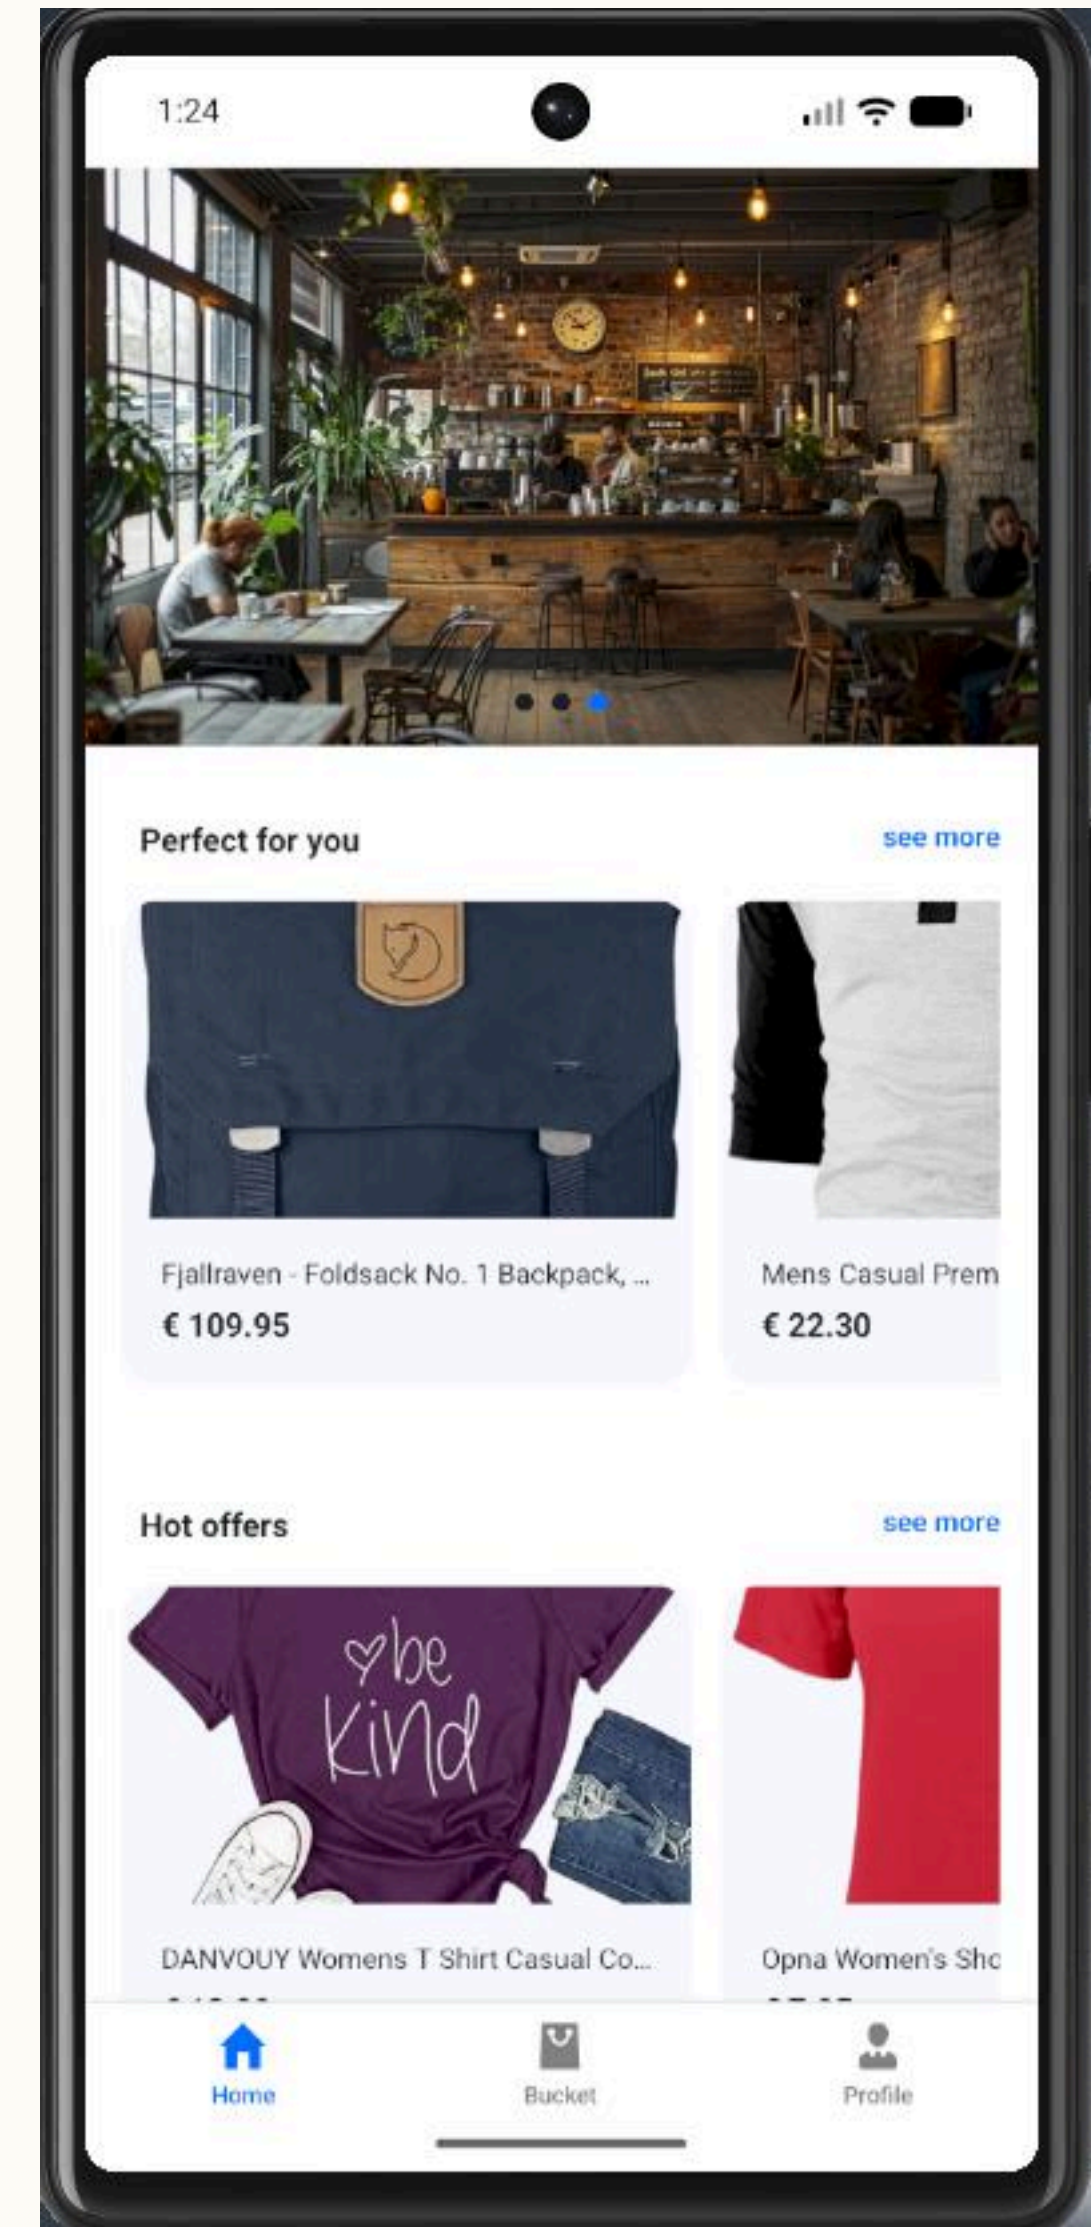

Presentation of the project concept and architecture

The main idea

Creating a fast, intuitive and aesthetic interface for ordering your favorite drinks without queues

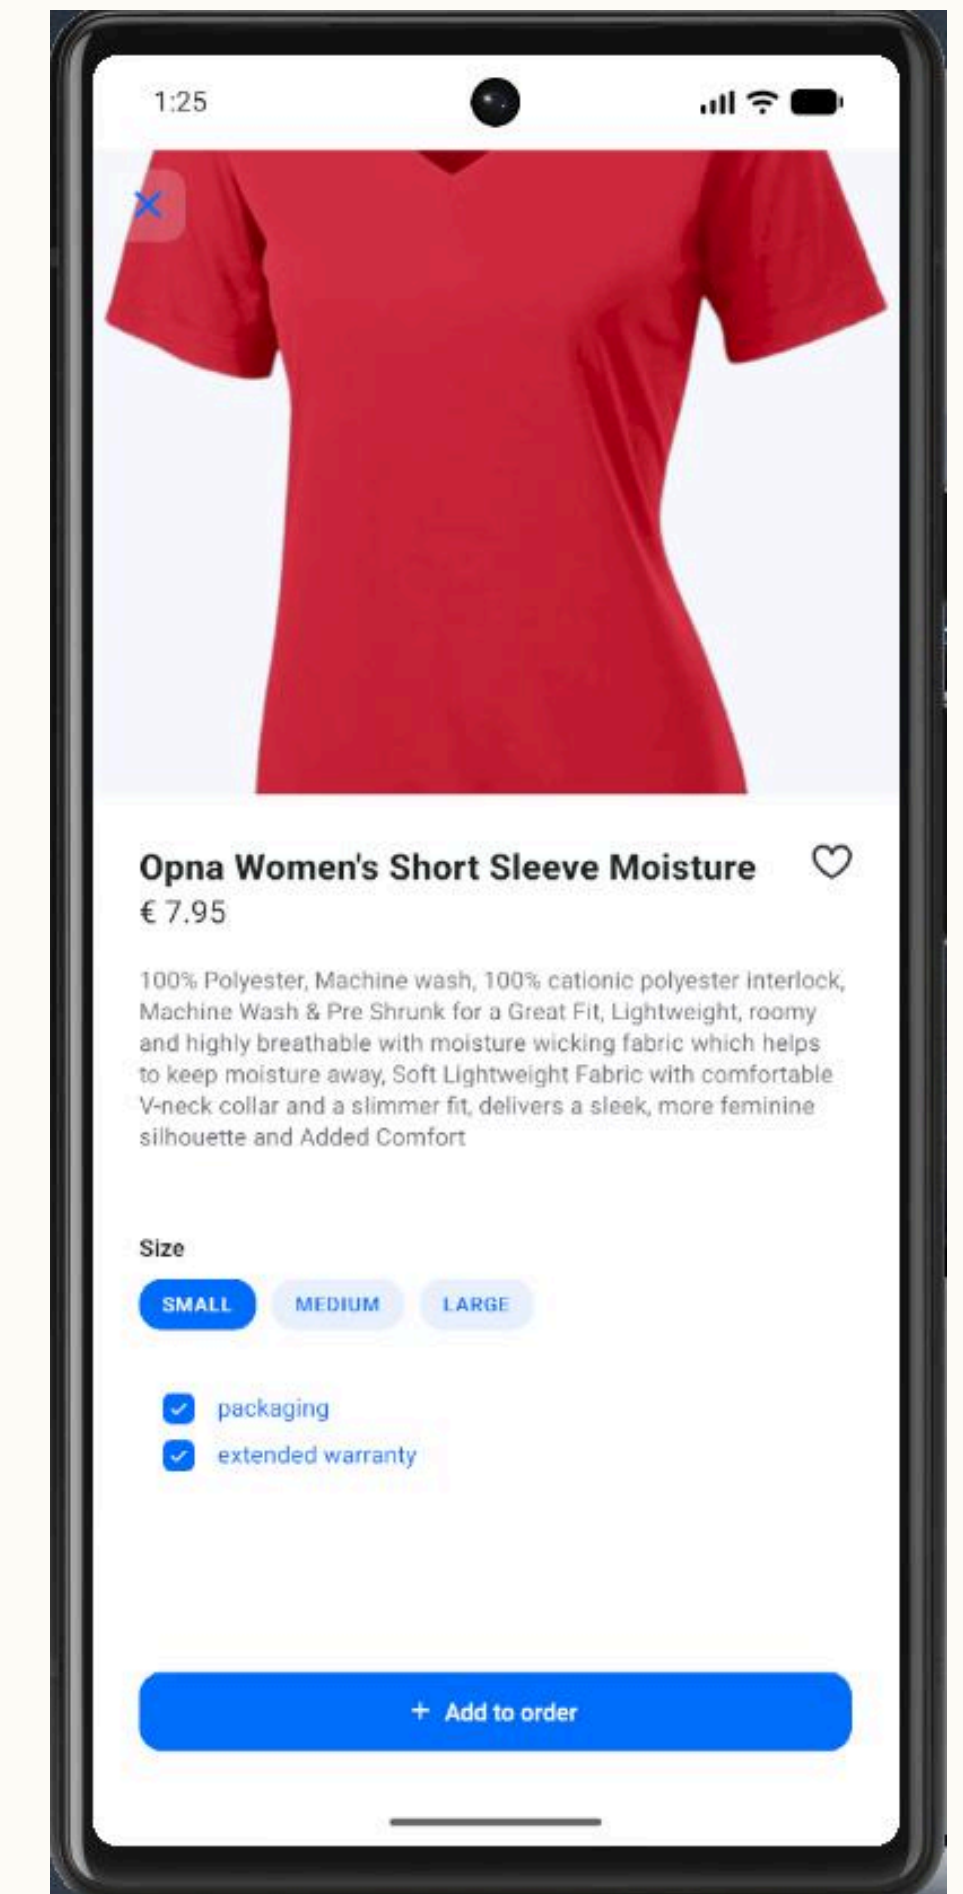

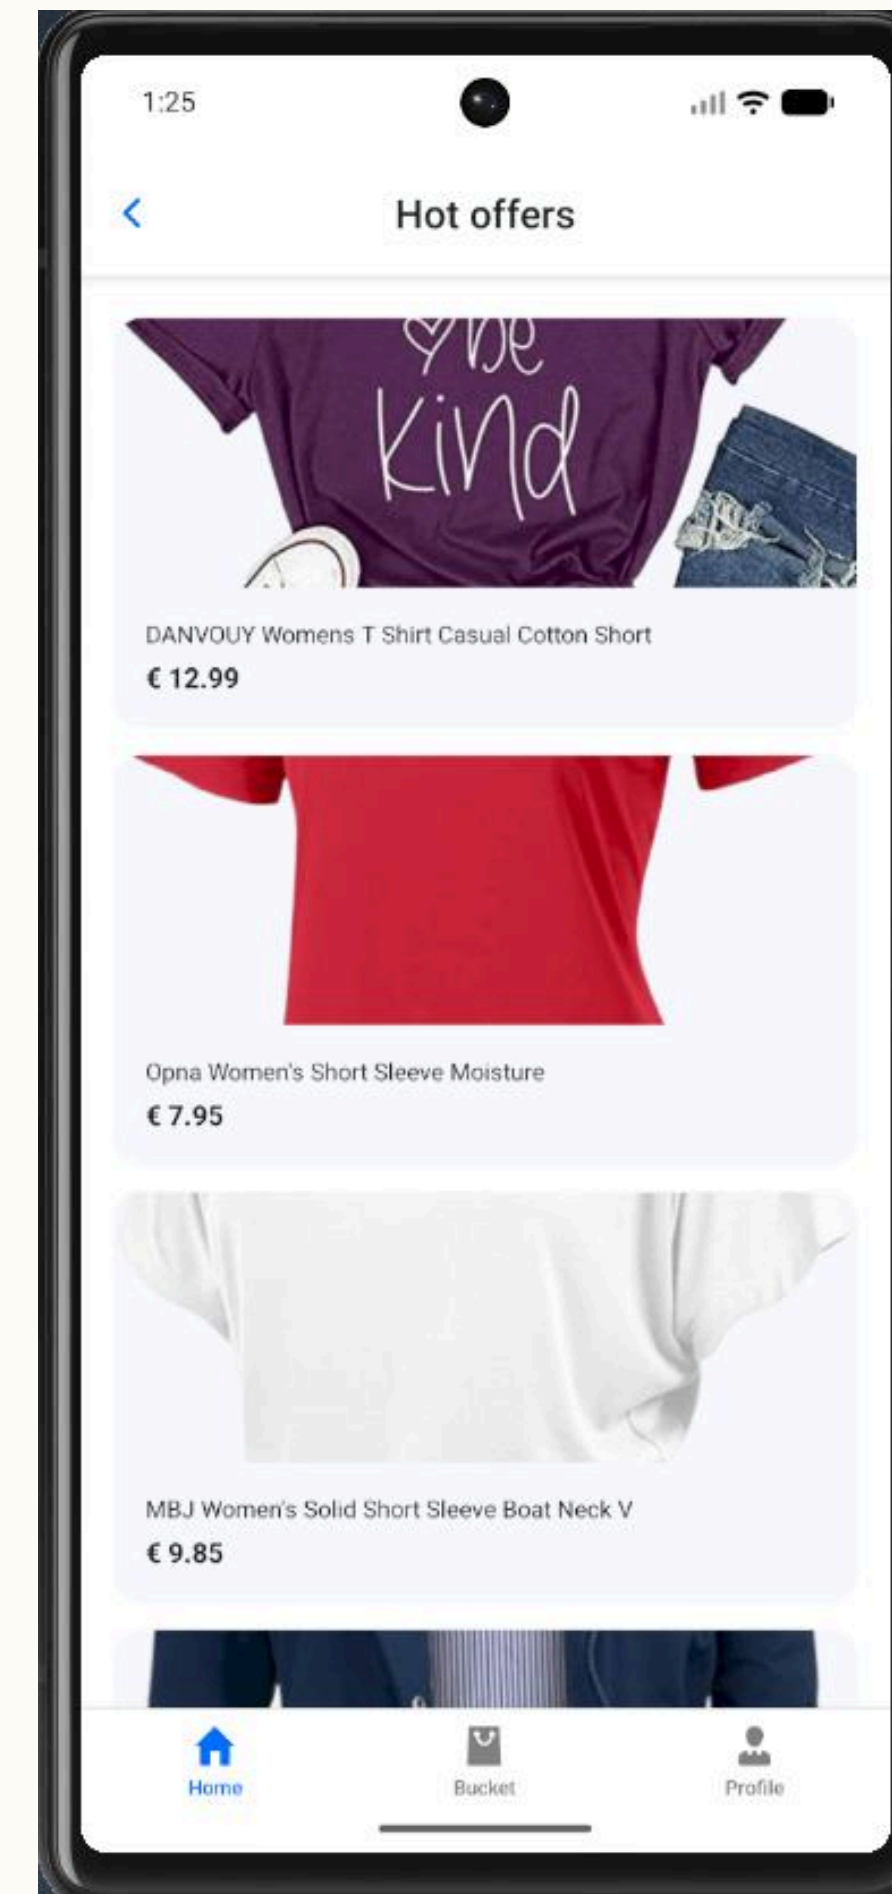

Key highlights:

- Speed: Ordering coffee takes just a few clicks
- Personalization: Ability to customize any drink to the customer's taste
- Modern UX: Adaptation to the rhythm of big city life - opened, selected, picked up

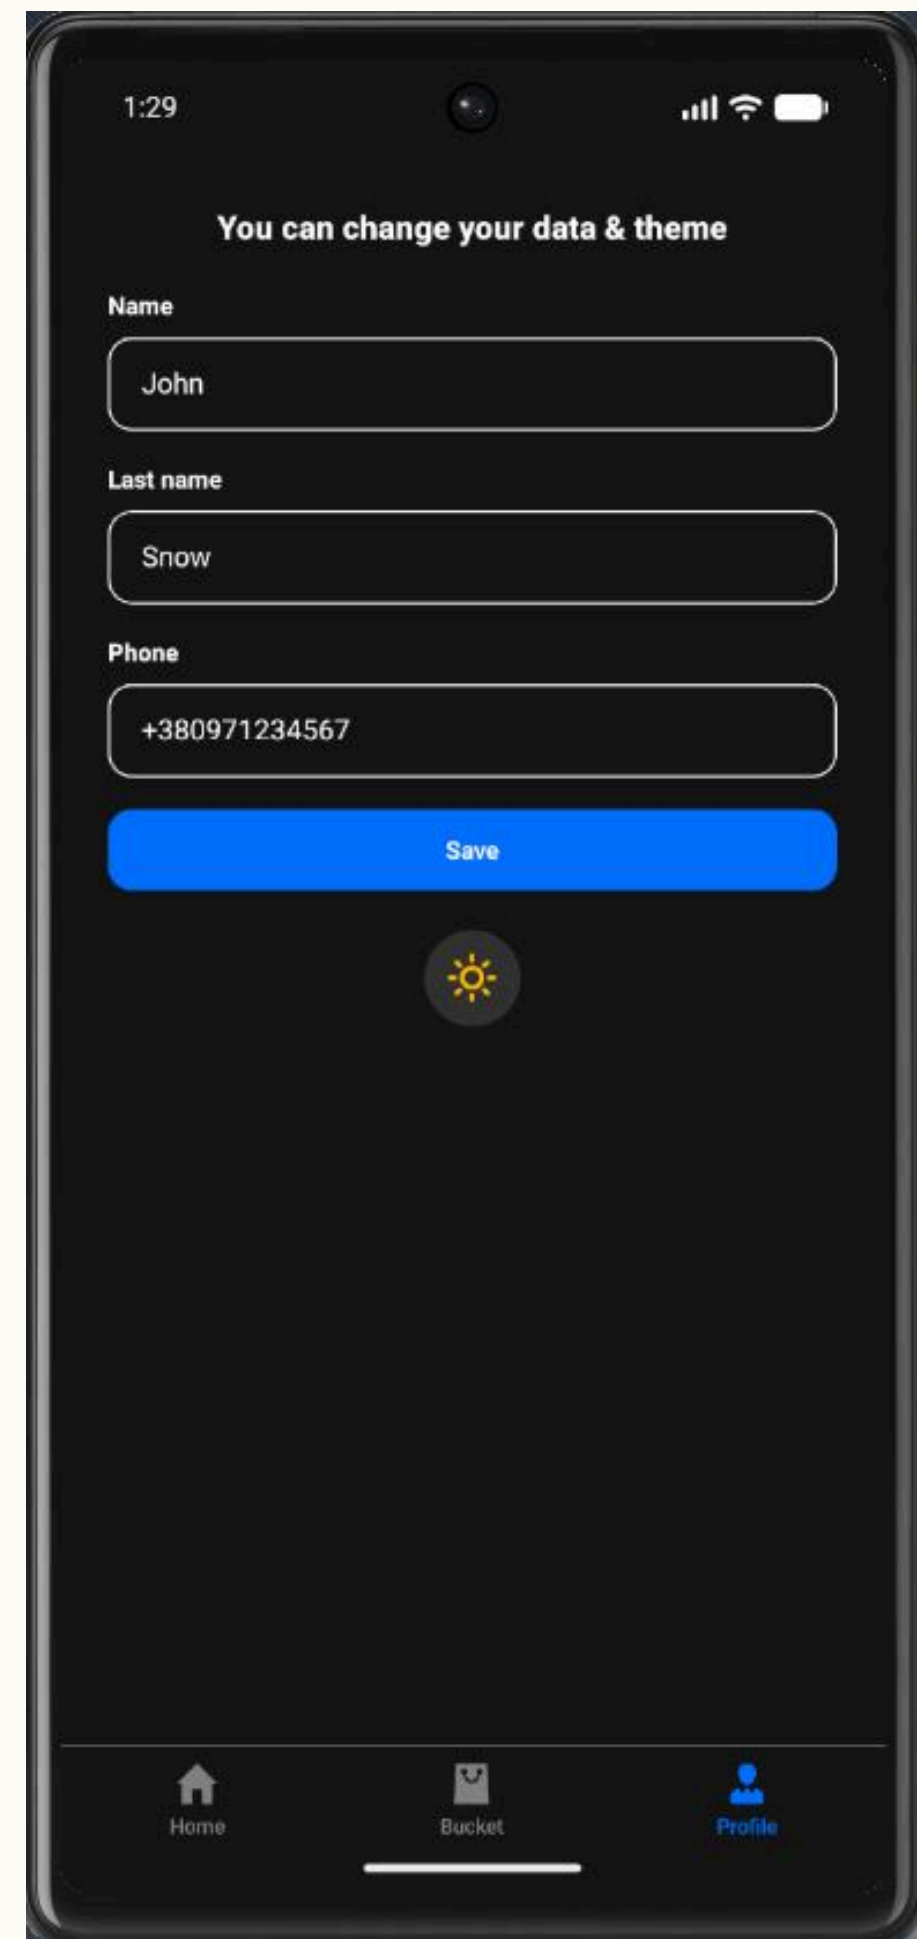

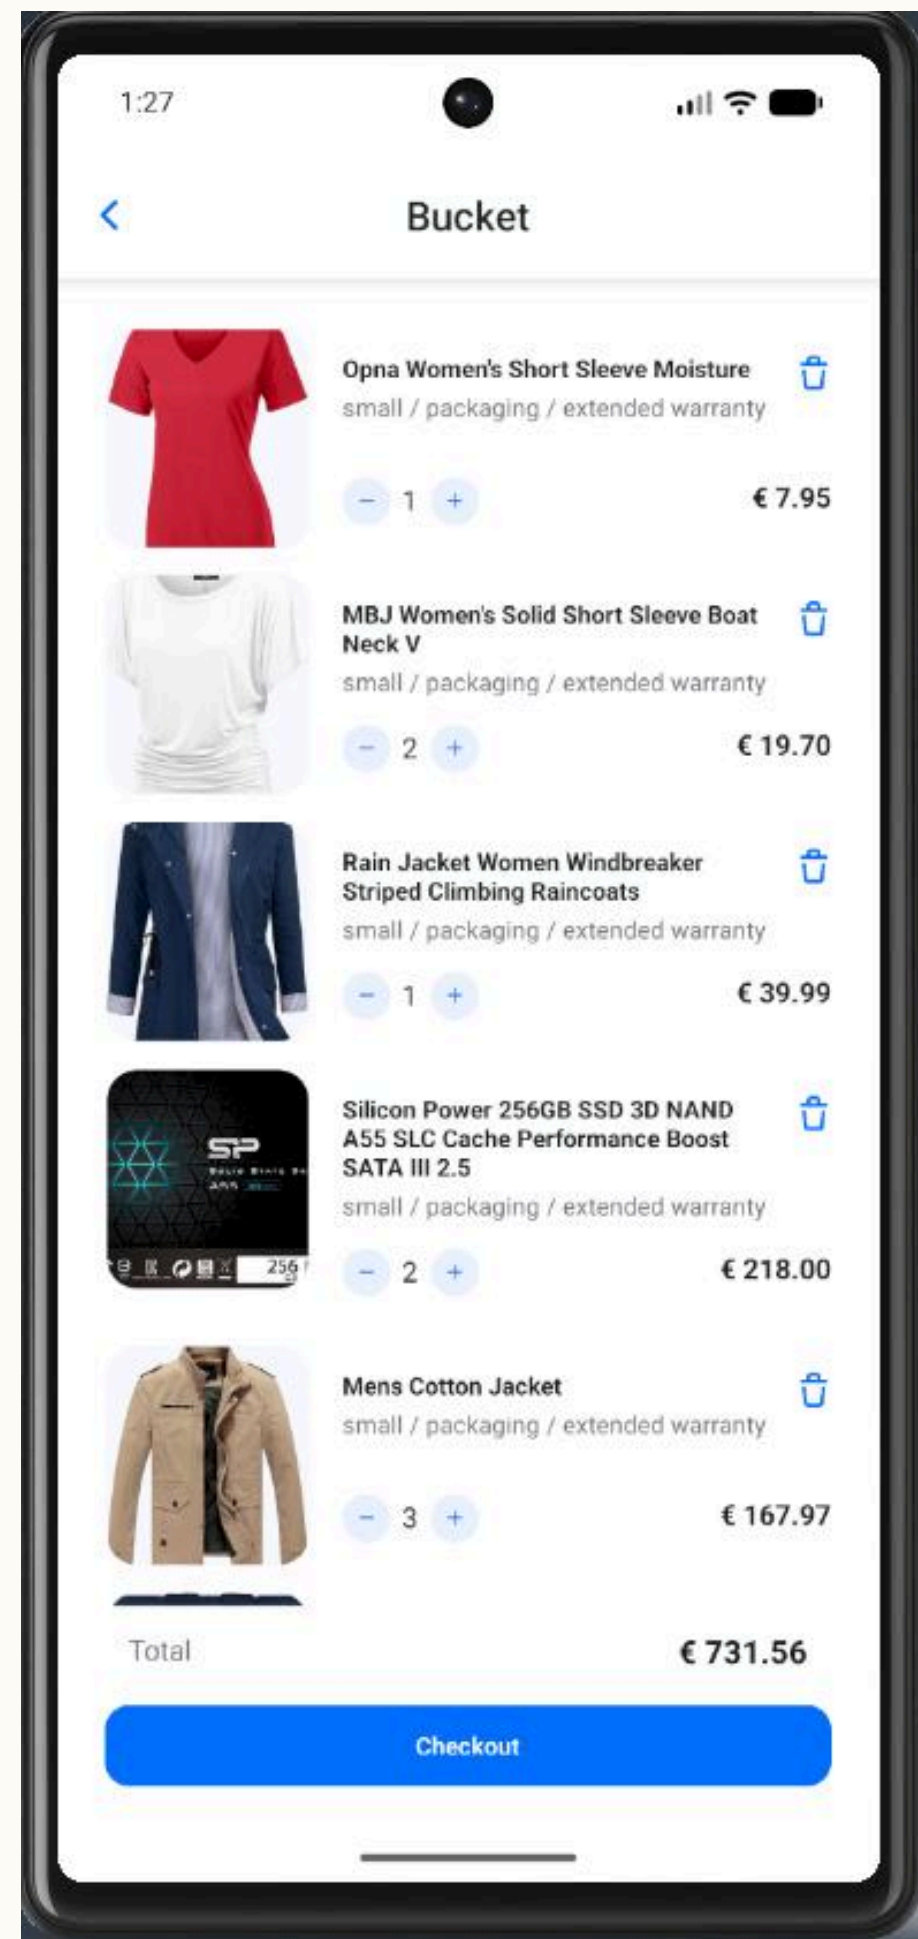

Functionality and UX innovations

- Flexible customization (Options & Sizes): Interactive one-touch size and options selection using custom checkboxes
- Interactive interface: Smooth scrolling, providing quick access to the necessary products and their details even on small screens
- Smart geolocation (Geo-tracking): The application automatically determines the location of the user required for delivery

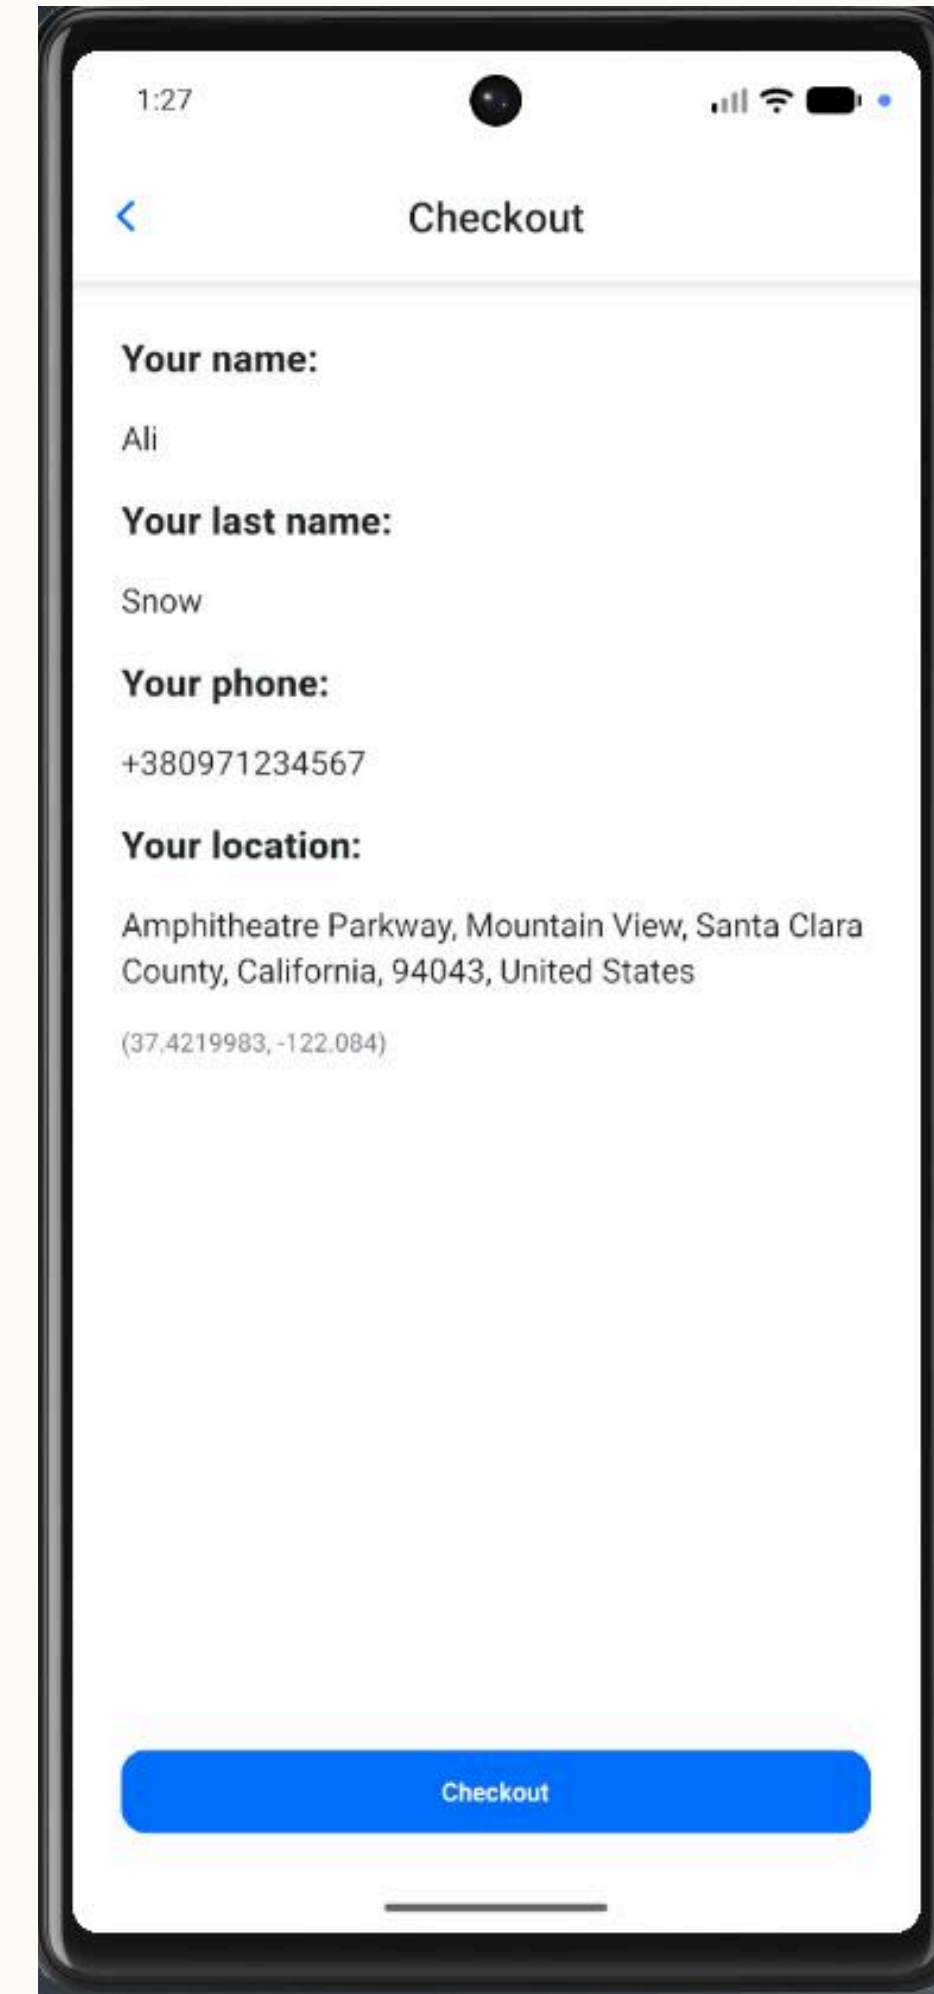

A structure that provides convenience

- Global State (Redux Toolkit): Manages the dynamic state of the cart
- Profile Localization (Context API): Reliably and easily stores user data (name, phone) for quick order processing without re-entry
- Theme Change (Context API): Applies theme changes throughout the application for a comfortable experience

Project result

The application combines a clean and optimized code base (React Native + Redux Toolkit) with modern UI/UX design requirements. It is a ready-made business solution that minimizes the user's journey from wanting to drink coffee to receiving it.
